

## YEAR 9 GEOGRAPHY – CYCLE 3 – RIVER LANDSCAPES

### BOX 1: UK PHYSICAL LANDSCAPES

fluvial landscape	<b>extensive area of land</b> → has been <b>shaped</b> by a flowing <b>river</b>
fluvial landform	a <b>specific feature</b> found in river landscapes e.g. a <b>waterfall</b> landform
UK upland areas	<b>more than 200m</b> above sea level → mostly <b>north/west</b> UK e.g. <b>Pennines</b>
UK lowland areas	<b>less than 200m</b> above sea level → mostly <b>south/east</b> UK e.g. <b>The Fens</b>
UK river systems	many river systems in the UK e.g. the <b>River Severn</b> → <b>longest river in UK</b>

### BOX 2: FLUVIAL PROCESSES

erosion	to <b>erode</b> → the <b>wearing away</b> and <b>removal</b> of <b>sediment</b> (e.g. rocks)
transportation	to <b>transport</b> → eroded <b>sediment</b> is <b>moved</b> to a <b>new location</b> by water
deposition	to <b>deposit</b> → eroded <b>sediment</b> is <b>dropped</b> when the <b>water loses energy</b>

### BOX 3: TYPES OF EROSION

1. hydraulic action	moving <b>water forces</b> air into <b>cracks</b> in <b>rocks</b> → <b>pressure weakens rocks</b>
2. abrasion	<b>rocks</b> carried by river <b>wear down</b> the <b>river bed</b> and <b>banks</b>
3. attrition	<b>rocks</b> carried by river <b>smash together</b> → get <b>smaller smoother rounder</b>
4. solution	<b>soluble</b> particles of <b>sediment</b> are <b>dissolved</b> into the <b>river</b>
5. vertical erosion	<b>downward erosion</b> of <b>bed</b> (bottom of river)
6. lateral erosion	<b>sideways erosion</b> of <b>banks</b> (sides of river)

### BOX 4: TYPES OF TRANSPORTATION

1. traction	the <b>rolling</b> of <b>boulders</b> and <b>large pebbles</b> along the <b>river bed</b>
2. saltation	particles of <b>sediment</b> <b>bouncing</b> along the <b>river bed</b>
3. suspension	<b>small pieces</b> of <b>sediment</b> <b>floating</b> in the <b>moving river water</b>
4. solution	<b>soluble</b> particles of <b>sediment</b> are <b>moved</b> whilst <b>dissolved</b> in flowing <b>river</b>

### BOX 5: WHY DO RIVERS DEPOSIT SEDIMENT?

river loses energy	1) at <b>inside bend</b> of a <b>meander</b> 2) in <b>shallow water</b> 3) at <b>mouth</b> of <b>river</b>
--------------------	--

### BOX 6: RIVER KEYWORDS

source	<b>where</b> a river <b>begins/starts</b> → <b>upland areas</b> ( <b>upper course</b> )
mouth	<b>where</b> a river <b>ends/flows into sea</b> → <b>lowland areas</b> ( <b>lower course</b> )
channel	the <b>area</b> in the <b>river</b> where the <b>water flows</b> e.g. the <b>river bed</b> and <b>banks</b>
valley	the <b>V shaped</b> area of <b>land</b> around a <b>river</b>

### BOX 7: HOW DOES THE PROFILE OF A RIVER CHANGE FROM SOURCE TO MOUTH?

	<b>cross profile</b>	<b>long profile</b>
upper course/source	channel <b>narrow/shallow</b> → valley <b>steep V</b> shaped	<b>steepest</b> gradient
middle course	channel <b>wider/deeper</b> → valley <b>flatter</b> shape	<b>medium</b> gradient
lower course/mouth	channel <b>widest/deepest</b> → valley <b>wide/flat</b> shape	<b>flattest</b> gradient

### BOX 8: FLUVIAL LANDFORMS FORMED BY EROSION → UPPER COURSE

1. interlocking spurs	river <b>erodes softer rock</b> → leaves 'zip' shaped <b>pattern</b> of <b>harder rocks</b>
2. waterfalls	<b>hard rock</b> on top of <b>soft rock</b> → <b>soft rock erodes</b> → <b>hard rock overhangs</b>
3. gorges	overhanging <b>rock</b> at waterfall <b>collapses</b> → waterfall <b>retreats</b> → <b>gorge</b>

### BOX 9: FLUVIAL LANDFORMS FORMED BY EROSION + DEPOSITION

1. meanders	<b>faster flow</b> on <b>outside bank</b> = <b>lateral erosion</b> → <b>slower flow</b> on <b>inside bank</b> = <b>deposition</b> → creates <b>bend shape</b> in river called a <b>meander</b>
2. oxbow lakes	<b>flood breaks</b> through <b>meander neck</b> → creates new <b>channel</b> and <b>lake</b>

### BOX 10: FLUVIAL LANDFORMS FORMED BY DEPOSITION → LOWER COURSE

1. levées	<b>flood</b> → <b>heaviest sediment</b> <b>deposited</b> <b>river edge</b> → creates <b>higher banks</b>
2. flood plains	<b>lateral erosion</b> of <b>meanders</b> makes <b>lower course</b> of <b>valley wider/flatter</b>
3. estuaries	<b>mouth</b> of some rivers <b>flooded</b> by rising <b>sea levels</b> after <b>last ice age</b> ended

### BOX 11: HOW DO PHYSICAL FACTORS AFFECT FLOOD RISK?

flood risk	<b>predicted frequency</b> of <b>floods</b> in an <b>area</b> → how <b>likely</b> an <b>area</b> is to <b>flood</b>
1. precipitation	<b>prolonged, intense rainfall</b> can <b>saturate soil</b> → increases <b>surface run-off</b>
2. geology - rock type	<b>water cannot infiltrate impermeable rock</b> → increases <b>surface run-off</b>
3. relief	<b>water cannot infiltrate</b> into <b>steep slopes</b> → increases <b>surface run-off</b>

### BOX 12: HOW DO HUMAN FACTORS AFFECT FLOOD RISK?

1. land use	<b>impermeable surfaces</b> (e.g. <b>tarmac</b> ) and <b>deforestation</b> increase <b>flood risk</b>
-------------	---

### BOX 13: HYDROGRAPHS

hydrograph	shows <b>link</b> between <b>discharge</b> and <b>precipitation</b> over period of <b>time</b>
discharge	<b>volume</b> of <b>water</b> flowing past a point on a <b>river</b> (e.g. <b>per second</b> )
lag time	<b>length of time</b> between <b>peak</b> (highest) <b>precipitation</b> and <b>peak discharge</b>

### BOX 14: MANAGEMENT STRATEGY 1 → HARD ENGINEERING → ARTIFICIAL

	<b>benefits ☺</b> → positives	<b>costs ☹</b> → negatives
dams and reservoirs	used to <b>store water</b>	<b>people</b> displaced by <b>construction</b>
river straightening	<b>water flows away</b> more <b>quickly</b>	<b>flood risk</b> increases <b>downstream</b>
embankments	<b>higher banks</b> hold <b>more water</b>	can be <b>unattractive</b>
flood relief channels	<b>river</b> has <b>extra capacity</b> for <b>water</b>	<b>expensive</b>

### BOX 15: MANAGEMENT STRATEGY 2 → SOFT ENGINEERING → NATURAL

	<b>benefits ☺</b> → positives	<b>costs ☹</b> → negatives
flood warnings	<b>warning</b> people → can <b>evacuate</b>	<b>does not stop</b> the <b>flooding</b>
flood plain zoning	<b>important buildings</b> not near <b>river</b>	<b>less land</b> for <b>housing</b>
planting trees	trees <b>infiltrate</b> and <b>absorb</b> <b>water</b>	<b>less land</b> available for <b>farming</b>
river restoration	<b>reduces flooding</b> <b>downstream</b>	<b>floods</b> still likely near <b>restoration</b>

### BOX 16: CASE STUDY → FLOOD MANAGEMENT SCHEME IN THE UK → LEEDS

scheme/strategy	<b>Leeds Flood Alleviation Scheme</b> → <b>glass embankments, deflatable weirs</b>
required because	<b>reduce flooding</b> from <b>River Aire</b> → e.g. <b>large flood</b> in <b>Leeds</b> 26 <sup>th</sup> Dec <b>2015</b>
social issues	<b>paths</b> near <b>river</b> may still <b>flood</b> and <b>moves water</b> to <b>homes</b> <b>downstream</b>
economic issues	<b>expensive</b> → predicted to cost <b>£160 million</b> to finish the <b>entire project</b>
environmental issues	some <b>habitats</b> <b>disturbed</b> during the <b>construction</b> of the <b>scheme</b>

## YEAR 9 GEOGRAPHY – CYCLE 3 – RIVER LANDSCAPES
