

1 – Covalent Bonding	
Covalent Bond	Bond formed between two <b>non-metal atoms</b> when they share a <b>pair of electrons</b> .
Double Covalent Bond	Bond formed between two <b>non-metal atoms</b> when they share <b>two pairs of electrons</b> .
Electrostatic Attraction	Between the <b>negative shared electrons</b> and the <b>positive nuclei</b> of the atoms.
2 – Simple Molecular Covalent Substances	
Structure	<b>Small molecules</b> made up of atoms <b>covalently bonded</b> together. <b>Weak intermolecular forces</b> between molecules. E.g. methane ( $\text{CH}_4$ ), ammonia ( $\text{NH}_3$ ).
Melting & Boiling Points	<b>Low</b> -> <b>intermolecular forces</b> are <b>weak</b> -> do <b>not</b> require much <b>energy</b> to break.
Size of Molecule	<b>Larger</b> molecules -> <b>stronger</b> intermolecular forces -> <b>higher</b> melting and boiling point.
Conductivity	Do <b>not conduct</b> -> no <b>charged particles</b> .
3 – Polymers Covalent Substances	
Structure	<b>Long chain molecules</b> made up of <b>repeating units</b> called <b>monomers</b> . <b>Intermolecular forces</b> between molecules. E.g. poly(ethene)
Melting & Boiling Points	<b>Higher</b> than simple molecular covalent as <b>larger molecules</b> . But <b>lower</b> than ionic and giant covalent.
Conductivity	Do <b>not conduct</b> -> no <b>charged particles</b> .
4 – Giant Covalent Substances	
Structure	<b>Giant molecule</b> made up of <b>very many atoms</b> all bonded to each other by <b>strong covalent bonds</b> . E.g. diamond, graphite and silicon dioxide ( $\text{SiO}_2$ ).
Melting & Boiling Points	<b>High</b> -> many <b>strong</b> covalent bonds -> require a lot of <b>energy</b> to break.
Conductivity	Do <b>not conduct</b> -> no <b>charged particles</b> (except graphite).

5 – Allotropes of Carbon (contain covalent bonds)	
Diamond	Each carbon <b>bonded</b> to <b>4</b> others. Very <b>hard</b> . Very <b>high</b> melting point. Does <b>not conduct</b> . Uses -> <b>cutting and drills</b> .
Graphite	Each carbon <b>bonded</b> to <b>3</b> others. <b>Sheets</b> of atoms arranged in <b>hexagons</b> . <b>Weak</b> forces between sheets -> can <b>slide</b> over each other. <b>Conducts electricity</b> -> free <b>electrons</b> . Uses -> <b>lubricants and pencil lead</b> .
Graphene	<b>Single sheet</b> of <b>graphite</b> . Very <b>light</b> and <b>conducts electricity</b> . Uses -> <b>strengthening materials</b> and <b>electronics</b> .
Fullerenes	Molecules of carbon shaped like <b>tubes</b> or <b>balls</b> . E.g. Buckminsterfullerene = $\text{C}_{60}$ . Uses -> <b>lubricants, electronics, catalysts</b> and <b>strengthening</b> .
6 – Metallic Bonding	
Structure	<b>Lattice</b> of <b>positively charged metals ions</b> surrounded by a <b>sea of delocalised electrons</b> . Held together by <b>strong electrostatic forces</b> .
Melting & Boiling Points	<b>High</b> -> many <b>strong</b> electrostatic forces -> require a lot of <b>energy</b> to break.
Electrical Conductivity	<b>Conduct electricity</b> -> <b>free electrons</b> can move through <b>whole structure</b> -> carry <b>charge</b> .
Thermal Conductivity	<b>Conduct heat</b> -> <b>free electrons</b> can move through <b>whole structure</b> -> carry <b>thermal energy</b> .
Malleability	Can be <b>bent</b> or <b>hammered</b> into shape -> <b>layers</b> of atoms can <b>slide</b> over each other.
Alloys	<b>Mixture</b> of <b>metals</b> or a <b>mixture</b> of a <b>metal</b> and a <b>non-metal</b> .
Strength of Alloys	Different <b>sized</b> atoms -> <b>distorts layers</b> so they <b>cannot slide</b> over each other -> <b>stronger</b> than <b>pure metal</b> .

## GCSE Science

### Chemistry C2 – Covalent & Metallic Bonding
